Ventiduct Wood

Heating Stove.

A new principle in heating. The cold air is taken from the floor, carried through ventiduct pipes and comes out at the top of stove highly heated; thus thoroughly heating the remote corners of the room by hot air circulation.

REVERTIBLE FLUE.

Has Ventiduct Heating Pipes, running through the Flues.

In design and ornamentation this stove is very handsome. It is made and mounted in the very best and most substantial manner, has smooth castings. The ornamentation is very rich and tasty. Has nickel-plated base and legs, nickel rail, four nickel pilasters, large nickel front panel, and bronze top ornament. The top swings off and the top griddles remain in place, by simple device, when the pan is raised. Smoke curtain at end door, and nickel door in front, with spark arrester.
